

Momentum Creation System v2

Local Run & Team-Deployment Guide • Repo: D:\momentum-creation-system-v2 • Branch: task-9-qa-compliance • Prepared 2026-06-20

Status in one line: the code is essentially complete — all 154 API routes are mounted and the server boots. What turns “built” into “running on your screen” is three things: the `.env` (done), a free port 7700, and seed data for login.

1. At a glance

Surface	Folder	Dev URL	Audience
Prospect site (.com)	apps/com	http://localhost:7701	Public — no login
BA cockpit (.team)	apps/team	http://localhost:7702	Brand Ambassadors — login
Admin	apps/admin	http://localhost:7703	Kevin only — login
API server	server	http://localhost:7700/api	Shared backend

Ports are fixed (`strictPort`). The v2 Universal Gateway runs on `localhost:2526` (NOT 2525 — that is the v1 gateway).

2. Prerequisites (must be up first)

Service	Where	Needed for
Universal Gateway v2	localhost:2526	All data reads/writes (Mongo/Neo4j/Chroma/Surreal fan-out)
MongoDB / Neo4j / ChromaDB / SurrealDB	via the gateway	Persistence
GPU embedding service	localhost:8300	ChromaDB writes (384-dim)
Node + pnpm	local	Node 24 confirmed present

3. Run it locally

- ☐ **Environment file — already done.** `.env` exists at the repo root with a 256-bit `JWT_SECRET` , `ADMIN_BA_IDS=TMBA-FOUNDER-KEVIN` , and `GATEWAY_URL=http://localhost:2526/api` .
- ☐ **Free port 7700.** Another process currently holds it, and all three front-ends are hard-wired to call the API there, so v2’s server must own 7700. Identify and stop the occupant (or decide it is the one to keep).

```
Get-NetTCPConnection -LocalPort 7700 -State Listen |  
ForEach-Object { Get-Process -Id $_.OwningProcess } | Format-List Id,Path
```

- ☐ **Install dependencies** (likely already installed):

```
cd D:\momentum-creation-system-v2  
pnpm install
```

- ☐ **Build the shared package once** (so imports resolve):

```
pnpm build:shared
```

- ☐ **Start everything** (server + all three clients in parallel):

```
pnpm dev:all
```

Or run separately: `pnpm dev:server` , `pnpm dev:com` , `pnpm dev:team` , `pnpm dev:admin` .

6. ☐ **Open in the browser:**
 - `http://localhost:7701` — prospect site (public, no login) — **fastest thing to see.**
 - `http://localhost:7702` — BA cockpit (needs login).
 - `http://localhost:7703` — admin (needs login).
7. ☐ **Seed data so logins work** (otherwise the database is empty). From the repo root:

```
pnpm --filter @momentum/server seed:founders
pnpm --filter @momentum/server setup:founder-access
pnpm --filter @momentum/server seed:codes
pnpm --filter @momentum/server seed:webinar-events
pnpm --filter @momentum/server seed:orientation-sessions
pnpm --filter @momentum/server bootstrap:ivory
```

Confirm which of these are required for a working login before running blind — founders + founder-access are the ones that create your account.

Fastest path to seeing *something*: steps 2 → 4 → 5, then open `http://localhost:7701`. The prospect site renders with no login and no data.

4. Current state & known gaps (honest)

Item	State
All 154 API routes	Mounted & responding (verified by full sweep)
Tasks 1–8 (UX redesign)	Merged to main
Task 9 (QA/compliance)	Committed on its branch, NOT yet merged (no PR #15); plus uncommitted docs on that branch
Gateway health route	Reports 503 — false negative (pings unsupported <code>mongodb:ping</code>); real gateway calls work
Michael interview (4 routes)	503 until <code>ANTHROPIC_API_KEY</code> is set (LLM dependency)
Ivory / ScriptMaker (LLM)	Degrade to manual until <code>ANTHROPIC_API_KEY</code> is set
Email (Resend)	Dormant — not configured; sends are skipped/logged
SMS / calls (Telnyx)	Dormant — not configured
Compiled pnpm start path	Needs <code>pnpm build:shared</code> first; <code>tsx dev</code> path works now

5. Phase 2 — deploy for the team (10-day target)

High-level target plan from the prior production brief. Confirm specifics before executing each line.

1. ☐ **Merge Task 9** and prune stale duplicate remote branches; tag a release commit on `main`.
2. ☐ **Provision the host** (VPS — InterServer or your Quasar VPS). Install Docker + Docker Compose.
3. ☐ **Managed data layer:** MongoDB Atlas as the authoritative store, Neo4j Aura for the genealogy graph; decide Chroma + Surreal hosting. MongoDB stays the single write authority.
4. ☐ **Reverse proxy + TLS:** Caddy in front of the apps for automatic HTTPS.
5. ☐ **Production secrets/env:** real `JWT_SECRET`, set `JWT_COOKIE_DOMAIN=.teammagnificent.team`, `ADMIN_BA_IDS`, `GATEWAY_URL`, `PROSPECT_BASE_URL=https://teammagnificent.com`.
6. ☐ **Turn on the dormant integrations:** verify `teammagnificent.com` in Resend (DNS) for email; add Telnyx keys for Michael's calls; add `ANTHROPIC_API_KEY` for Michael/Ivory/ScriptMaker.
7. ☐ **DNS:** point `teammagnificent.com` → `com`, `teammagnificent.team` → `team`, `admin.teammagnificent.team` → `admin` (Namecheap).
8. ☐ **Seed founders + access** on production; smoke-test login on each surface.
9. ☐ **Compliance pass on .com**: no income/placement/CV/rank language; PMV wording only.
10. ☐ **Onboard the team:** issue access codes, walk the welcome → Michael → Launch Center flow.

Momentum Creation System v2 — internal run/deploy guide. Ports, gateway (2526), and route status verified against the live repo on 2026-06-20. Phase-2 specifics are a target plan to confirm.
